

Four times in. Your tenths out.

After you land, type your Ramp Out, Takeoff, Landing and Ramp In. ZuluFox works out air time and flight time in tenths, ready for your logbook.

The screenshot shows the ZuluFox app interface. At the top, it displays 'LOCAL TIME 11:05:12' and 'Sat, 25 Oct UTC 1705Z'. Below this, a section for 'Leg 1' is highlighted with an orange border. It contains four input fields: 'RAMP OUT' with '09:30', 'TAKEOFF' with '09:42', 'LANDING' with '0000', and 'RAMP IN' with '0000'. Below these are two fields for 'AIR TIME' and 'FLIGHT TIME', both showing a blue minus sign. At the bottom, there is a dashed blue button labeled 'Type Landing'.

Fly first, log after

Jot your times on your kneeboard. Type them in after shutdown, four digits each.

0.1

Tenths, done for you

Air time first, then flight time, with day totals across every leg.
